Materia: Taller de desarrollo 4

Instalar Docker en Ubuntu

A terminal window titled "trickster@TrickyLap: ~" with standard macOS window controls. The terminal output shows the command `sudo docker run hello-world` and its output, which includes a welcome message and a list of steps taken by Docker. A context menu is open over the terminal, displaying options like "New Window", "Full Screen", "Read-Only", "Advanced", "Preferences", "Help", and "About".

```
trickster@TrickyLap:~$ sudo docker run hello-world

Hello from Docker!
This message shows that your installation appears to be working correctly.

To generate this message, Docker took the following steps:
1. The Docker client contacted the Docker daemon.
2. The Docker daemon pulled the "hello-world" image from the Docker Hub
   (amd64).
3. The Docker daemon created a new container from that image which runs the
   executable that produces the output you are currently seeing.
4. The Docker daemon streamed that output to the Docker client, which sent it
   to your terminal.

To try something more ambitious, you can run an Ubuntu container with:
$ docker run -it ubuntu bash

Share images, automate workflows, and more with a free Docker ID:
https://hub.docker.com/

For more examples and ideas, visit:
https://docs.docker.com/get-started/

trickster@TrickyLap:~$
```

trickster@TrickyLap: ~
